

Sepsis: Empiric Antibiotic Selection Pathway

Early initiation of appropriate therapy is associated with improved outcomes in severe sepsis and septic shock and these guidelines are intended for use in patients with these syndromes only. All patients with suspected sepsis should have appropriate cultures obtained, although antimicrobial therapy should not be unduly delayed for this. Delays in initiating active therapy have been associated with worsened clinical outcomes and so antimicrobials should be initiated as rapidly as possible. The addition of a second antimicrobial agent can expand the empiric coverage for resistant Gram-negative pathogens. This combination therapy has been advocated by international consensus guidelines (Surviving Sepsis Campaign) in critically ill patients in severe sepsis or septic shock given delays to active therapy in this population has been associated with an increased mortality. Despite the clear mortality benefit of initially active therapy in critically ill patients, combination therapy remains controversial. The addition of a second agent has not been definitively associated with improved outcomes and depending on the severity of illness and patient population may be associated with worsened outcomes. Therefore, the addition of a second agent (e.g. tobramycin added to anti-pseudomonal beta-lactam) should be based on patient severity of illness, the likelihood of isolating resistant Gram-negative pathogens, and the potential adverse effects of additional therapy. Antibiotic therapy should be narrowed to target the isolated pathogen when culture results become available. Patients who have milder forms of infection may be more appropriately treated with narrow spectrum agents and antibiotic choices in these patients should be based upon current guidelines and clinical judgment. De-escalation to a single active agent is **strongly** recommended when culture and susceptibility results return.

EIAD: extended interval aminoglycoside dosing panel

+/- denotes that the drug is optional and use should be based on assessment of severity of infection and likelihood of resistance or isolation of the pathogen the agent targets

Suspected Source of Infection	Suggested Antibiotics
Unknown (includes catheter related blood stream infection) ‡	<p style="text-align: center;">Vancomycin IV per pharmacy consult (initial 25mg/kg loading dose) PLUS EITHER Piperacillin/tazobactam 4.5g IV q8h, infused over 4 hours OR Cefepime 1 gm IV q6hr +/- Tobramycin 7 mg/kg IV EIAD</p> <p style="text-align: center;"><u>Severe beta-lactam allergy (anaphylaxis, hives):</u> Vancomycin IV per pharmacy consult (initial 25mg/kg loading dose) PLUS Aztreonam 2 gm IV q8h +/- Tobramycin 7 mg/kg IV EIAD</p> <p>‡Consider Micafungin 100mg IV qday in patients at high risk for invasive candidiasis. Major risk factors predicting candidemia at TNMC include: 1) Broad-spectrum antibiotics, 2) Central venous catheter, 3) Receipt of TPN, 4) Abdominal surgery, and 5) Steroid use. Presence of 2 or fewer of the risk factors suggests a 99.4% chance of not developing candidemia, while patients with >2 risk factors have a 4.7% risk of developing candidemia. See Institutional Guidelines for the Treatment of Invasive Candidiasis for further information.</p>
Intra-abdominal Source	<p style="text-align: center;">Piperacillin/tazobactam 4.5g IV q8h, infused over 4 hours OR Cefepime 1g q6h hours PLUS Metronidazole 500 mg IV q8h +/- Gentamicin OR Tobramycin 7 mg/kg IV EIAD +/- Vancomycin per pharmacy consult (initial 25mg/kg loading dose)</p>

	<p style="text-align: center;"><u>Severe beta-lactam allergy (anaphylaxis, hives):</u> Vancomycin per pharmacy consult (initial 25mg/kg loading dose) PLUS Aztreonam 2gm IV q8h PLUS Metronidazole 500 mg IV q8h +/- Gentamicin OR Tobramycin 7 mg/kg IV EIAD</p>
<p>Urinary Tract</p> <p>Patients should be assessed for risk of multi-drug resistant pathogens.</p> <p>Suggested risk factors for resistant pathogens:</p> <ol style="list-style-type: none"> 1) Residence in long-term care facility (LTCF) 2) Recent receipt of broad spectrum antibiotics 3) History of MDR urinary pathogen 4) History of recurrent UTI 5) Nosocomial UTI 	<p style="text-align: center;">Not at risk for multi-drug resistant organisms Ceftriaxone 1g IV q24h (2 grams if >80kg) +/- Gentamicin 7 mg/kg EIAD</p> <p style="text-align: center;"><u>Severe beta-lactam allergy (anaphylaxis, hives):</u> Aztreonam 2 gm IV q8hr +/- Gentamicin 7 mg/kg IV EIAD</p> <p style="text-align: center;">At risk for multi-drug resistant organisms Cefepime 1 gm IV q6hr OR Piperacillin/tazobactam 4.5g IV q8h, infused over 4 hours +/- Gentamicin 7 mg/kg IV EIAD +/- Vancomycin per pharmacy consult (initial 25mg/kg loading dose)</p> <p style="text-align: center;"><u>Severe beta-lactam allergy (anaphylaxis, hives):</u> Aztreonam 2 gm IV q8h PLUS Gentamicin 7 mg/kg IV EIAD PLUS Vancomycin per pharmacy consult (initial 25mg/kg loading dose)</p>
